

- 1 Reflectivity curves of high-reflecting gold, silver, and aluminum coatings.
- 2 Optical dense metal coating on glass substrate.
- 3 Reflectivity and transmission curves of a beamsplitter based on a semitransparent metal layer, angle of incidence  $45^\circ$ .

## METAL COATINGS FOR OPTICAL APPLICATIONS

### Motivation

In optical coating technologies, metals are indispensable coating materials for a multitude of applications. For example, broadband reflectors with the highest reflectivity can only be realized with metal coatings. Semi-transparent metal films can be applied as beamsplitters with low polarisation. In micro-optics, optical dense metal coatings are used as masks or apertures. Further applications take advantage of properties such as good adhesion, corrosion resistance, or a high melting temperature of metals.

### Our expertise

- Highly reflective and durable Al-, Ag-, and Au-layer systems
- Optical dense metal coatings
- Semi-transparent metal coatings
- Black metal coatings
- Solderable coatings

- Multitude of available coating materials: Au, Pt, Pd, Ru, W, Ag, Al, Mo, Ta, La, Cu, Ti, Ni, Cr, NiCr, Zr, Hf, Nb,...
- Thickness accuracy  $\Delta d/d < 1\%$
- Coatable substrate size up to - 500 x 500 mm<sup>2</sup> possible
- Deposition onto various substrate materials

### What we offer

- Development of metal coatings and metal-dielectric coatings
- Optimization of coating properties (stress, roughness, optical properties, electrical properties) according to customer specification
- Prototype coatings
